

# Invasive Species

*in the Cook Islands*

## Why are they a problem?

### Ship Rat

Scientific name: *Rattus Rattus* Local name: *Kiore Toka*

**Ship rats** are pests that feed on a wide range of native fruits and other plant materials competing with native birds for food. They are also known to eat birds eggs and young chicks which strongly impacts on our native and endangered bird populations.

### Polynesian mosquito

Scientific name: *Aedes polynesiensis* Local name: *Namu Tore*

Mosquito are a pest in the Cook Islands. They feed on humans and other animals by sucking there blood and are carriers of diseases.

### Mynah

Scientific name:  
*Acridotheres tristis*  
Local name:  
*Manu Kavamani*

Mynah birds are a pest that feed on fruits and vegetables. They also attack native birds for their nests.

### Crown of Thorns

Scientific name:  
*Acanthaster planci*  
Local name:  
*Taramea*

The crown-of-thorns starfish are found on coral reefs. They are a large, multiple-armed starfish that usually preys on hard corals. They feed on the coral polyps and eventually killing the coral by leaving a white scar of coral skeleton. They are harmful to humans when stepped on by local fishermans.
